R3465/3463

Modulation Spectrum Analyzers

Recently, digital mobile communication systems have been the focus of much attention. The R3465/3463 are new modulation spectrum analyzers for testing these new communication systems. In addition to the functions offered by conventional spectrum analyzers, the R3465/3463 have functions for analyzing digital modulated signals such as modulation accuracy and transmission speed. The units have an easy-to-use 'one key solutions' design that anyone can use. There are independent keys for STD mode which automatically sets PHS, PDC and NADC standard parameters and OBW, ACP and harmonic distortion measurement.

DDS (Direct Digital Synthesizer) technology enables the R3465/3463's excellent basic specifications to fit into a compact size 17 kg. These specifications include a frequency range of 9 kHz to 8 GHz (R3465) or 9 kHz to 3 GHz (R3463), highly stable narrow band sweep and high-speed measuring made possible by the newly-developed high speed settling synthesizer.

The R3465/3463 provide total support for digital mobile communication equipment in applications ranging from radio systems development to production line adjustment and testing.

■ Automatic Setting of Standard Parameters

The cumbersome parameter settings required for measuring digital radio system standards such as PHS, PDC and NADC (GSM, DCS1800, DCS1900, DECT and CDMA optional), are set automatically for each measurement item.

See the options table for each standard measurement.

■ Dual Mode Analysis

As well as CW mode, for conventional spectrum analysis, the R3465/3463 have a TRANSIENT mode for digital transmission analysis of modulation accuracy and transmission speed. The unit also employ the FAST function, a newly-developed measuring algorithm which greatly reduces the measurement time.

■ Menu Operation

The R3465/3463 have a 'one key solutions' design for simple operation. Basic measurement and analysis functions can be easily started by selecting the desired measurement item.

■ High Performance Spectrum Analyzer Functions

The R3465/3463 are high performance spectrum analyzers with ample basic functions for waveform analysis in minute detail. The newly-developed high speed settling synthesizer has greatly improved blanking time during narrow-band sweep (span \leq 5MHz), providing high speed measurement. The units have a frequency span accuracy of 1% or less, residual FM 3Hz_{p-p} or less /0.1 sec, and drift 20Hz or less (span \leq 5MHz). The R3465 also enables high frequency measurements with a dynamic range of 90 dBc using a 1.7 GHz (min.) built-in preselector.

1. **STD** Selection of Digital Radio Systems

The R3465/3463 can easily switch between radio systems such as PHS, PDC and NADC (GSM, DCS1800, DCS1900, DECT and CMDA optional).
