► RSA3408B

RSA3408B DC to 8 GHz Real-time Spectrum Analyzer with DPX™

The RSA3408B makes it easy for you to discover design issues that other signal analyzers miss. The revolutionary DPX spectrum display offers an intuitive live color view of signal transients changing over time in the frequency domain, giving you immediate confidence in the stability of your design or instantly displaying a fault when it occurs. This live display of transients is impossible with other signal analyzers. Once a problem is discovered with DPX, the RSA3408B Real-time Spectrum Analyzer (RTSA) can be set to trigger on the event in the frequency domain, capture a continuous time record of changing RF events and perform time-correlated analysis in all domains. You get the functionality of a high-performance vector signal analyzer, a spectrum analyzer and the unique discover-trigger-capture-analyze capability of a Real-time Spectrum Analyzer – all in a single package.

► Revolutionary DPX display discovers what other analyzers miss. This is an off-the-air capture of a frequency hopping signal jammed by large interference.

► Applications

► Characteristics

Discover

The DPX™ spectrum processing engine brings live analysis of transient events to spectrum analyzers. Performing more than 48,000 frequency transforms per second, transients as brief as 31 μ s are displayed in the frequency domain. This is orders of magnitude faster than conventional analysis techniques. Events are color-coded by rate of occurrence onto a bitmapped display, providing unparalleled insight into transient signal behavior.

Trigger

The Tektronix Frequency Mask Trigger (FMT, Opt. 02) makes it easy to trigger on signals in the frequency domain and capture transient signals in bandwidths up to 36 MHz. An FMT is simply configured to monitor all changes in frequency occupancy within the capture bandwidth. The Power Trigger, working in any capture bandwidth, fires at the instant in time when the RF input signal crosses a user-set power threshold. An external trigger is available for synchronization to test system events.

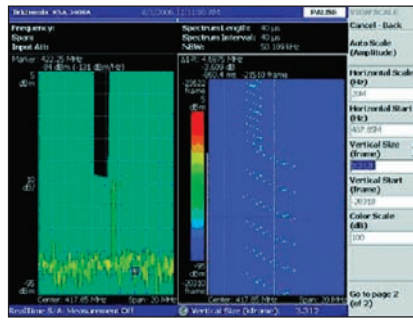

Capture

Unlike many SA/VSA combination instruments, the RSA3408B is fully preselected at all times for spurious and image rejection in any combination of capture bandwidth and frequency. Capture of small signals in the presence of large signals is enabled with 73 dB Spurious-Free Dynamic Range (SFDR) and class-leading image rejection in all capture bandwidths. Capture once with seamless acquisitions – make multiple measurements without recapturing. Record lengths vary depending upon the selected capture bandwidth-up to 1.28 seconds at 36 MHz, 51.2 seconds at 1 MHz or 1.42 hours at 10 kHz bandwidth with FMT/Deep Memory Option 02.
